

Upward Showering Muons in Super-Kamiokande

Shantanu Desai /Alec Habig

For

Super-Kamiokande Collaboration

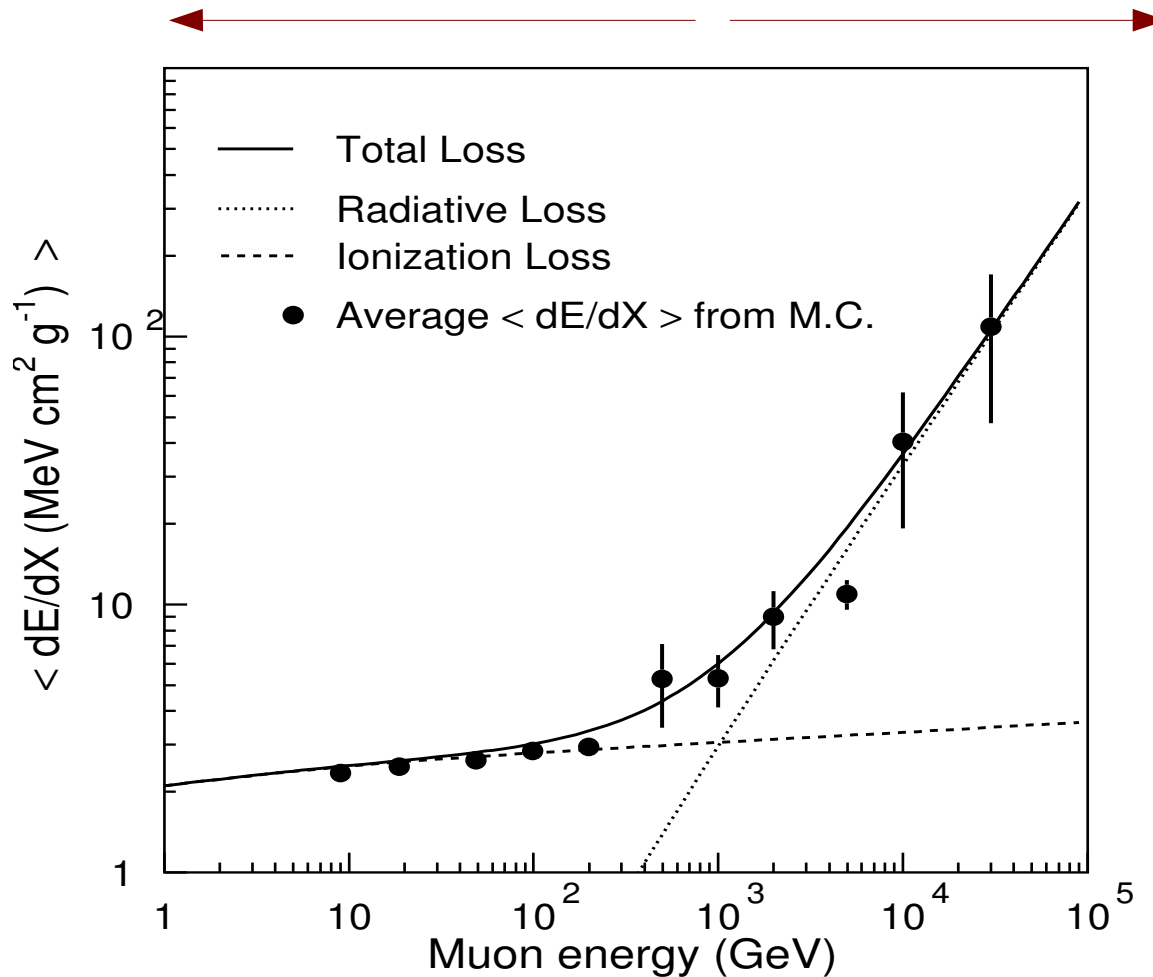

ICRC 2005 Pune

Upward Going Muons in Super-K

Muon Energy loss as a function of Energy

Non-Showering muon Showering Muon

$$dE/dX = (E_i - E_f)/L$$

Distribution
asymmetric
for each muon
energies

(Groom et al 03)

Reasonably good agreement of Monte-Carlo with PDG

Aim of this analysis is only to separate a given muon into showering/non-showering

Corrections to raw PMT charge

Apply following correction for every PMT in Cherenkov Cone

$$q_{\text{corr}} = \frac{q_{\text{raw}} d_{\text{wat}} \exp(d_{\text{wat}} / L_{\text{atten}})}{F(\theta)}$$

where L_{atten} = Water attenuation length,

d_{wat} = Distance from PMT to point of
projection to μ track

$F(\theta)$ = PMT acceptance + shadowing

Divide the muon track into 50 cm bins. For each bin, calculate average corrected charge and its statistical error as follows:

$$Q_{\text{corr}}^i = \sum_1^{N_{\text{pmt}}} \frac{q_{\text{corr}}}{N_{\text{pmt}}}$$

where N_{pmt} = No of pmts within the given
projected distance corresponding to each bin

$$\sigma_{Q_{\text{corr}}^i}^2 = \frac{1}{N_{\text{pmt}}^2} \sum_1^{N_{\text{pmt}}} \frac{q_{\text{corr}}^2}{q_{\text{raw}}}$$

Corrected Charge Distribution Comparison of ionizing vs showering muon

Muon Energy = 20 GeV

$dE/dX = 2.16 \text{ MeV/cm}$

Muon Energy = 10 TeV

$dE/dX = 8.5 \text{ MeV/cm}$

Both simulated muons have same entry point and direction

Variables used for showering/non-showering separation

$$\chi^2 = \sum_{i=3}^{n-2} \left\{ \left[Q_{corr}^i - \langle Q_{corr} \rangle \right]^2 / \sigma_{Q_{corr}^i}^2 \right\}$$

Shape Comparison

where

$$\langle Q_{corr} \rangle = \frac{\sum_{i=3}^{n-3} Q_{corr}^i / \sigma_{Q_{corr}^i}^2}{\sum_{i=3}^{n-3} 1 / \sigma_{Q_{corr}^i}^2}$$

(Average corrected charge averaged over entire muon length)

and

$$q(l) = \langle Q_{corr} \rangle \quad \text{for a ionizing muon as a function of path-length}$$

$$\Delta = \left[\langle Q_{corr} \rangle - q(l) \right] \longrightarrow$$

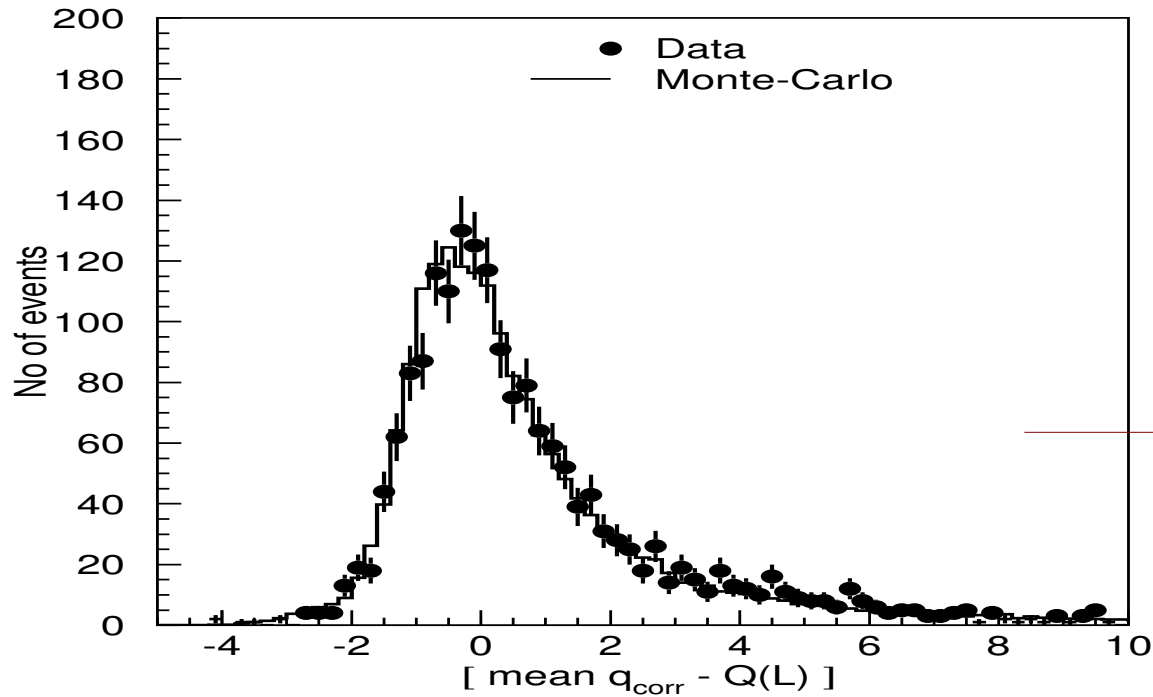

Difference in average corrected charge of given muon – same for ionzing muon

Absolute Corrected Charge Comparison

Variables when applied
to 100yr upmu NEUT
Monte-Carlo

→ χ^2 comparison
for data and monte-carlo

→ Δ comparison
for data and monte-carlo

SHOWERING CUT USED

$$\chi^2/\text{DOF} > 40 \text{ and } \Delta > 1.0$$

OR $\chi^2/\text{DOF} > 30 \text{ and } \Delta > 2.0$

OR $\chi^2/\text{DOF} > 20 \text{ and } \Delta > 2.5$

OR $\chi^2/\text{DOF} > 50 \text{ and } \Delta > 0.5$

OR $\Delta > 4.5$

Total no of showering events = 5575 (out of 37301)
in 100 year upmu NEUT Monte-carlo

Efficiency = 71 % where,

$$\text{Efficiency} = \frac{\text{No of events Identified by algorithm}}{\text{No of events with } \Delta E / \Delta X > 2.85 \text{ MeV/cm}}$$

ΔE = Energy deposited by muon in inner detector

ΔX = Length of muon in inner detector

Angular Resolution of showering muons

Shaded region contains 68 % of total area

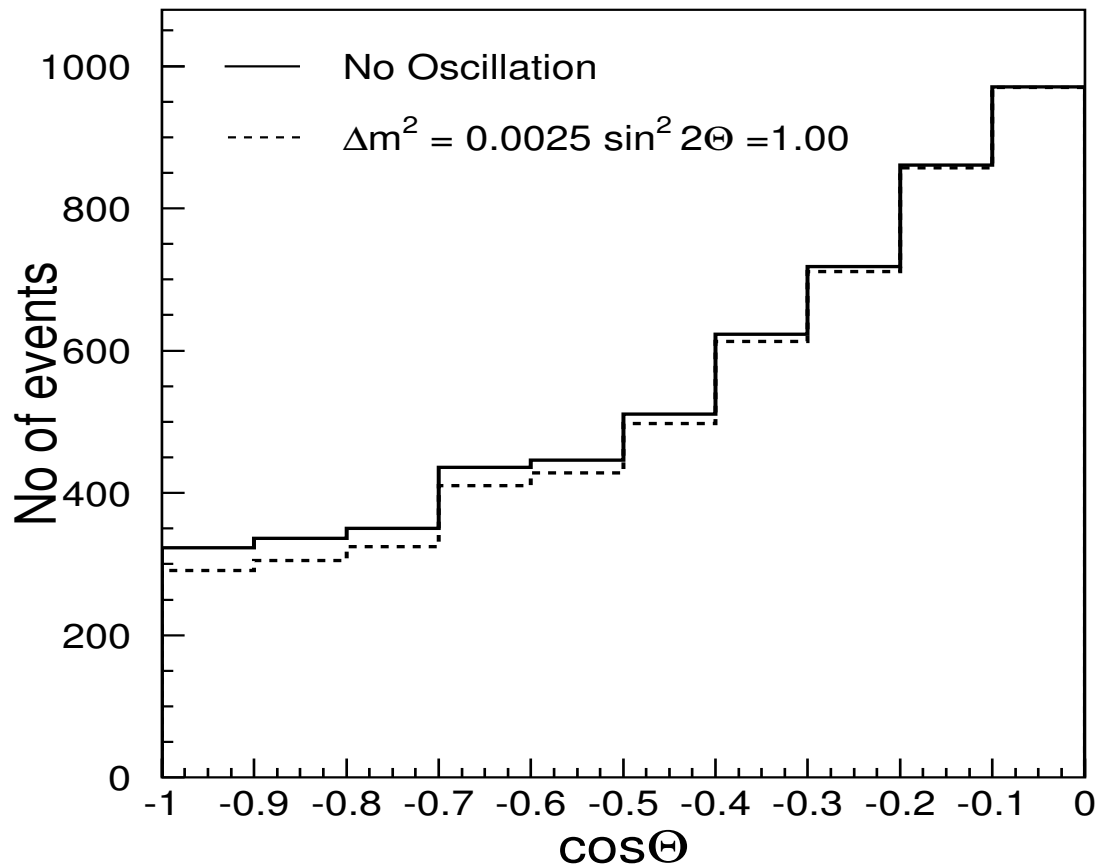

Angular resolution = 1.25°

Thrugoing muons : Angular resolution $\sim 1^\circ$

Stopping muons : Angular resolution $\sim 1^\circ$

Zenith-angle distribution of showering muons

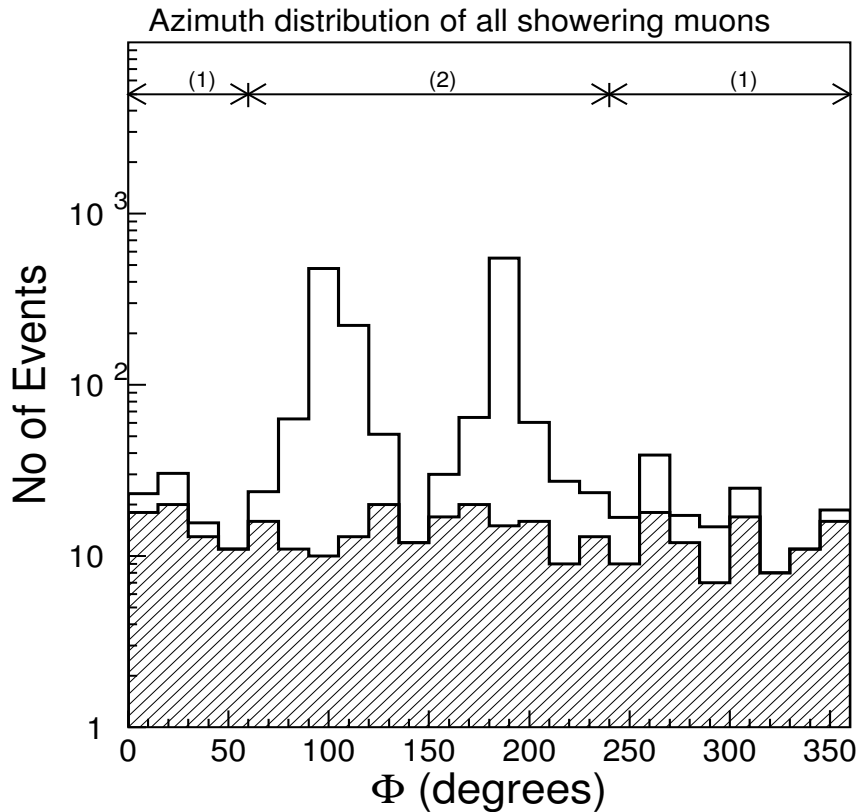

Showering muons relatively insensitive to oscillation

\implies For this dataset chi-square for null -oscillation should be very good fit

Background Subtraction

Applied the showering algorithm to horizontal thruoing muon with $0 < \cos(\theta) < 0.08$

Fit to thin rock zenith angle distribution: $f[\cos(\theta)] = p1 + \exp [p2 + p3 \cos(\theta)]$

$N_{\text{bkgd}} = 8.63^{+12}_{-5}$ for $\cos(\theta) > -0.1$ (Asymmetric distribution because of bump near horizon)

Showering Muon Oscillation Results

Best-fit (physical region) :

$$\chi^2 = 4.68 / 7 \text{ dof for } (\Delta m^2, \sin^2 2\theta) = (0.0104 \text{ eV}^2, 0.9)$$

Best-fit (null oscillation) :

$$\chi^2 = 6.51 / 9 \text{ dof}$$

Projections of chi-square distributions for showering muons

Null oscillation allowed even at 68 % confidence level as expected for this high energy ν_{μ} with mean energy of ~ 1 TeV

Comparison with all upward thru-going muons

Best-fit : $\chi^2 = 7.64 / 7$ dof for $(\Delta m^2, \sin^2 2\theta) = (0.0024 \text{ eV}^2, 0.96)$

Best-fit at null oscillation : $\chi^2 = 19.6/9$ dof

→ Upward thru-going muons sensitive to neutrino oscillation

CONCLUSIONS

- A sample of upward thru-going muons which lose energy through radiative processes have been identified.
- Mean energy of parent neutrinos of upward showering muons ~ 1 TeV.
- 5575 showering muons in 100yr neut Monte-carlo and 309 events in 1679.6 days data
- Zenith angle distribution of upward showering muons consistent with null oscillations
- This dataset will now be used for oscillation analysis with all datasets by providing an extra energy bin at highest energies.
- A variety of astrophysical searches with upward showering muons done. Nothing found. (*S. Desai thesis 2003. Also A. Habig poster*)
